

Computer Science RST

- ☐ A brief, one paragraph description of your chosen project idea.
- ☐ A GANTT chart that includes important milestones for the project. You should plan the implementation portion to span the course of 2 school days.
- ☐ A structure chart outlining the input, processing and output components required within the program.
- ☐ A flowchart for two subroutines within the program.
- ☐ A test plan for your program.

Description of chosen program - Hangman

My chosen program for my RST is the well known game called "hangman." In this program the user's objective is to guess a nine letter word randomly chosen by the program. The user will be asked to input one character that they think is in the word and if he or she guesses correctly then they are shown the placing of the letter in the following format; "_ _ _a _a _". The user is able to repeatedly guess multiple times until they complete the word and win the game or lives run out. If the user gets it wrong then a life is taken from the 9 lives that they have. If they lose their lives without successfully guessing the word then they lose. This program display method is a Graphical user interface(GUI).

Test Plan

If word is "abandoned"

Test Case (User input)	Expected case	Generated Output	Changes made
ab	error		
a	a _ a _ _ _ _ _		
q	Lives -1		
First attempt - a Second attempt - d	a _ a _ d _ _ _ d		
First attempt - a Second attempt - c	a _ a _ _ _ _ _ Lives -1		
8	error		
o	_ _ _ _ _ o _ _ _ _		

Points system (win/lose)

Test Case	Expected case	Generated Output	Changes made
If word spelled out fully; eg abandoned	Display "You win"		
If lives <=0	Display "You lose"		
If points = 9	Display "You win"		
If lives = 4	No output		
If points = 6	No output
